1 Introducción

En el presente trabajo se creo un circuito capaz de emular el comportamiento de una lavadora que cuenta con 3 diferentes modos de carga (baja, media y alta) y cuatro ciclos diferentes de lavado (suministrar de agua, lavar, enjuagar, centrifugar), para ello se utilizaron una serie de componentes electrónicos, donde el más importante de ellos es el microcontrolador ATTINY4313.

El circuito final se compone de tres partes fundamentales, los circuitos de entrada del microcontrolador que son 4 botones(ON/PAUSE, BAJA, MEDIA Y ALTA) los cuales tienen un circuito simple para evitar los rebotes de los botones. Luego tenemos las salidas del microcontrolador que constan de las señales de salida para controlar tanto los leds que muestran el estado de la lavadora, en otras palabras que indican si está ON o en PAUSE, si la carga es baja, media o alta, y si estamos en una de las cuatro secuencias de lavado: suministro, lavar, enjuagar o centrifugar, junto con estos leds también se controlan dos displays de cuatro segmentos que se encargan de mostrar la cuenta regresiva según el nivel de carga en el que esté operando la lavadora.

Con la implementación propuesta se logró hacer funcionar el circuito cumpliendo con todas las especificaciones.

El repositorio de Github se puede consultar en la siguiente dirección:

https://github.com/JackTheKnife16/IE-0624_Laboratorio_de_Microcontroladores_I_2023

2 Nota Teórica

En este apartado se mostrarán algunas características del microcontrolador así como la justificación de la utilización de los componentes externos y el diagrama de flujo del firmware creado para el microcontrolador.

2.1 Microcontrolador ATTINY4313

2.1.1 Características Generales

El microcontrolador ATTINY4313 cuenta con las siguientes características:

- Microcontrolador AVR de 8 bits.
- Arquitectura RISC/Harvard.
- 2/4Kb Flash, 128/258 bytes de SRAM y 128/258 bytes de EEPROM.
- Timer/Counter de 8 y 16 bits.
- 4 canales PWM y comparador analógico.
- USI, USART

2.1.2 Diagrama de Bloques

En la Figura 1 se muestra en detalle el diagrama de bloques del microcontrolador.

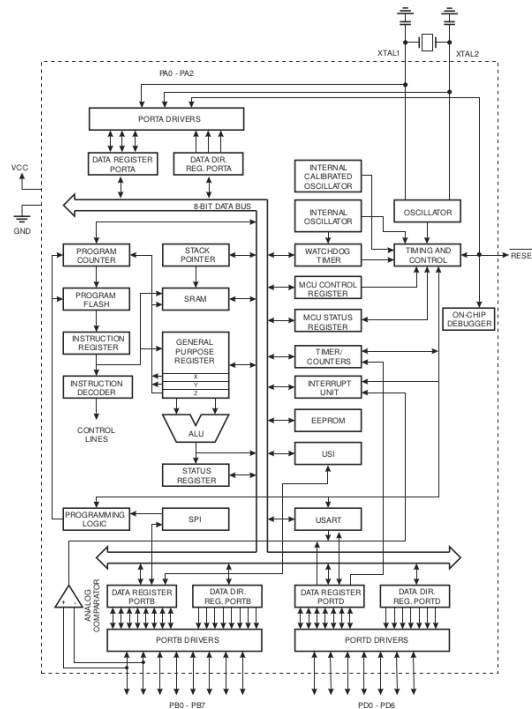

Figura 1: Diagrama de Bloques del ATTINY4313 [1]

2.1.3 Diagrama de Pines

En la Figura 2 se muestra el diagrama de pines del microcontrolador.

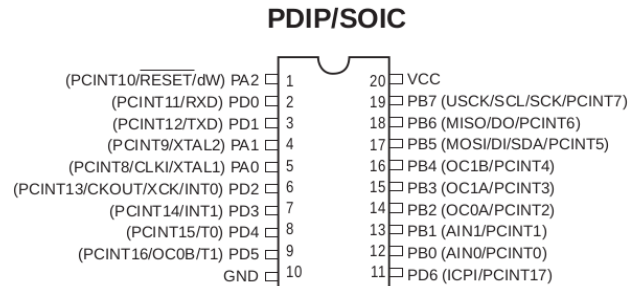

Figura 2: Diagrama de Pines del ATTINY4313 [1]

2.1.4 Características Eléctricas

En la Figura 3 se muestran las características eléctricas del microcontrolador.

Operating Temperature	-55°C to +125°C
Storage Temperature	-65°C to +150°C
Voltage on any Pin except $\overline{\text{RESET}}$ with respect to Ground	-0.5V to $V_{CC}+0.5V$
Voltage on $\overline{\text{RESET}}$ with respect to Ground	-0.5V to +13.0V
Maximum Operating Voltage	6.0V
DC Current per I/O Pin	40.0 mA
DC Current V_{CC} and GND Pins	200.0 mA

Figura 3: Características Eléctricas del ATTINY4313 [1]

2.2 Diagrama Funcional del Circuito

En la Figura 4 se muestra el diagrama funcional para el laboratorio, se puede ver la representación de cada una de las partes del circuito, que consta de 3, circuito de entrada, circuito de salida y microcontrolador. En la figura se esboza el circuito de funcionamiento de los displays de 7 segmentos que requieren demultiplexores, decodificadores bcd a 7 segmentos y un par de displays de 7 segmentos, mientras que para los leds de carga se utilizó un demultiplexor para poder controlar 3 leds con solo dos pines. Se ha tratado de usar la mayor cantidad de pines para evitar usar demasiada lógica externa.

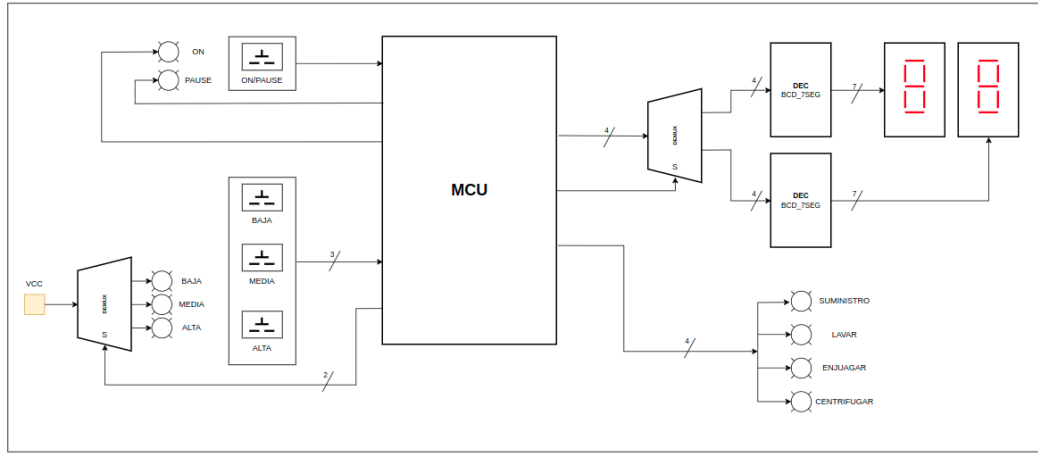

Figura 4: Diagrama funcional para la lavadora [imagen propia]

2.3 Firmware del Circuito

Se mencionará el funcionamiento de las 4 interrupciones a utilizar:

- ISR(INT0_vect): esta interrupción es la que maneja el botón ON/PAUSE, se dispara cuando se presiona el botón ON/PAUSE.
- ISR(PCINT2_vect): esta interrupción es la encargada de manejar los 3 botones para elegir el tipo de carga, se dispara cuando se presiona cualquier botón de la parte de Carga (BAJA, MEDIA, ALTA).
- ISR(TIMER1_COMPA_vect) se encarga de la cuenta regresiva y trabaja por comparación, en otras palabras cuando el contador interno del timer1 es igual al valor de comparación se dispara y este valor se eligió para que el disparo ocurra cada segundo aproximadamente.
- ISR(TIMER0_COMPA_vect) se encarga de refrescar los leds de 7 segmentos y de apagar todos los leds normales en el momento en que la cuenta llega a 0.

En las siguientes Figuras se muestran los diagramas para el firmware del laboratorio, consta del diagrama para main, las 4 interrupciones usadas

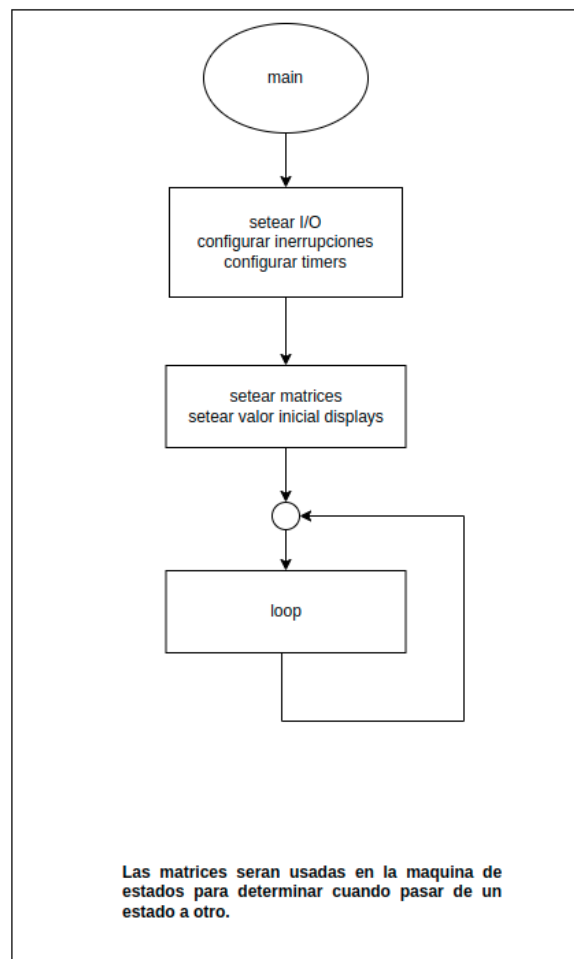

Figura 5: Diagrama del main [imagen propia]

Figura 7: Diagrama del ISR CARGA [imagen propia]

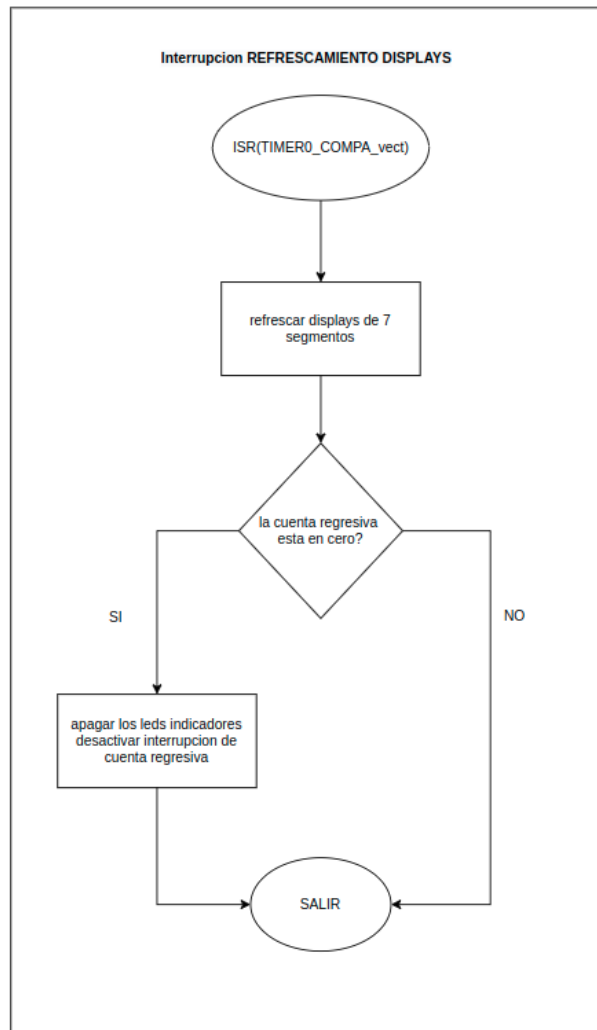

Figura 8: Diagrama del ISR TIMER 0 [imagen propia]

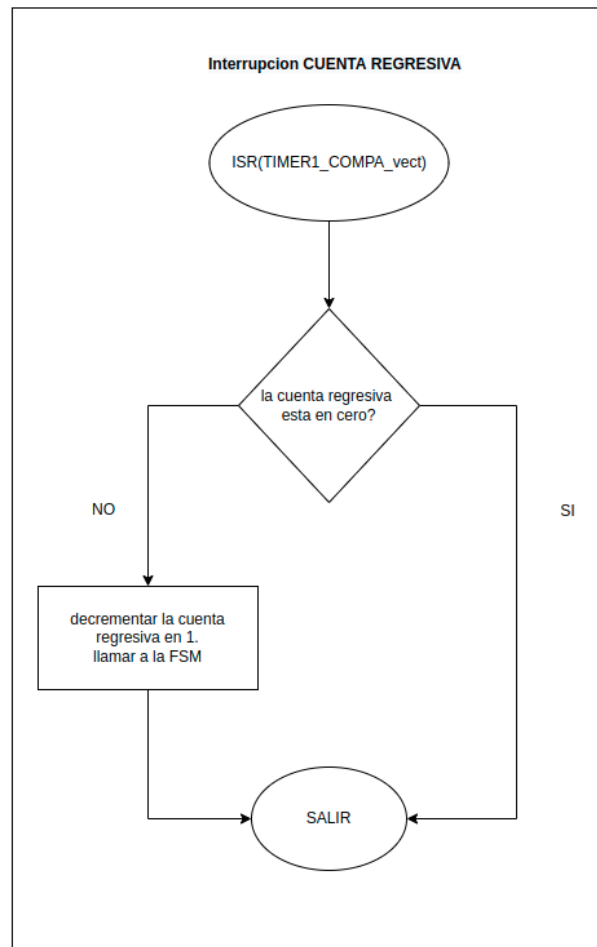

Figura 9: Diagrama del ISR TIMER 1 [imagen propia]

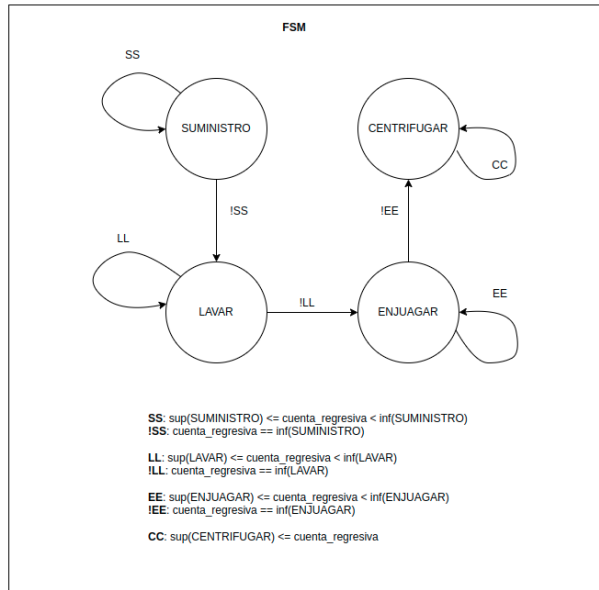

Figura 10: Diagrama de la FSM [imagen propia]

Para los detalles de la implementación se recomienda ver el código hecho.

2.4 Componentes Electrónicos Complementarios

El sistema que resuelve el problema planteado para este proyecto se diseñó con tres partes fundamentales, primero el circuito de entrada, segundo el microcontrolador y tercero el circuito de salida. En la Tabla se listan los componentes utilizados para cada uno de dichas partes, así como su precio en el mercado en colones.

Código	Tipo	Característica	Cantidad	Precio	Subsistema
ATTINY4313	Microcontrolador	-	1	1444	Microcontrolador
-	Capacitor	10 μF	4	190	Entrada
-	Pulsador	-	4	99	Entrada
-	Resistencia	100 Ω	4	199	Entrada
-	Resistencia	232 Ω	4	199	Entrada
-	Resistencia	90 Ω	14	199	Salida
74HC4511	Decodificador	-	2	915	Salida
157102B12700	Display 7 SEG	2.4 V , 20 mA	2	2373	Salida
74HC238	Demultiplexor	5 V	5	310	Salida
NTE4050B	BUFFER	5 V	1	591	Salida

Tabla 1: Información de los componentes utilizados

El precio calculado para estos componentes es de 15695 colones.

2.5 Diseño de los circuito Complementarios

Los circuitos complementarios serán explicados en detalle a continuación.

2.5.1 Circuito de Entrada

El circuito de entrada se compone de 4 pulsadores y un circuito RC para controlar los picos de tensión al accionar el pulsador para cada uno. El RC es un poco más complejo debido a que el microcontrolador requiere una resistencia de pull down para cada pin de entrada. Para este circuito se debía determinar el valor de dos resistencias y un capacitor conociendo ciertos datos:

- La tensión de entrada al PIN 3 del microcontrolador debe ser superior a 3 V ya que es suficiente tensión para que el microcontrolador reconozca como un valor en alto.
- El capacitor debe cargarse a su valor final en un tiempo no mayor a 5 ms, un tiempo mucho menor a la velocidad de reacción que puede tener un ser humano al pulsar un botón.

En la Figura 11 se muestra el esquemático del circuito de entrada, con este y un poco de cálculo se obtendrán los valores para las resistencias y la capacitancia.

Figura 11: Esquemático del Circuito entrada [imagen propia]

Aplicando Ley de Corrientes de Kirchhoff en el nodo a, obtenemos que:

$$\frac{5 - V_c}{R_1} = C \frac{dV_c}{dt} + \frac{V_c}{R_2} \quad (1)$$

Reacomodando la ecuación llegamos a:

$$\frac{dV_c}{dt} + \frac{R_1 + R_2}{CR_1 R_2} \cdot V_c = \frac{5}{CR_1} \quad (2)$$

sea $a = \frac{R_1 + R_2}{CR_1 R_2}$ y $b = \frac{5}{CR_1}$ tenemos que:

$$\frac{dV_c}{dt} + aV_c = b \quad (3)$$

Claramente el factor integrante para resolver este problema será: e^{at} , multiplicando esto a ambos lados de (3) y luego agrupando tenemos que:

$$\begin{aligned} e^{at} \frac{dV_c}{dt} + aV_c e^{at} &= b e^{at} \\ \frac{d}{dt} [e^{at} V_c] &= b e^{at} \\ d[e^{at} V_c] &= b e^{at} dt \end{aligned}$$

Integrando a ambos lados y luego despejando:

$$e^{at} V_c = \frac{b}{a} e^{at} + k$$

$$V_c = \frac{b}{a} + k e^{-at}$$

Suponiendo que en $t = 0$, $V_c(0) = 0$ (capacitor está descargado en el tiempo 0) entonces $k = -\frac{b}{a}$, por lo que:

$$\boxed{V_c = \frac{b}{a} [1 - e^{-at}]} \quad (4)$$

Sabemos por tanto que b/a es el valor de la tensión en régimen permanente, y fijaremos tal valor en 3.5 V :

$$\frac{b}{a} = \frac{5R_2}{R_1 + R_2} = 3.5$$

manipulando la ecuación se obtiene la relación entre las resistencias:

$$\boxed{R_2 = \frac{7}{3} R_1} \quad (5)$$

Por otro lado sabemos por los requerimientos mencionados antes que $5\tau \leq 5 \text{ ms}$

$$5\tau = \frac{5}{a} = \frac{5CR_1}{R_1 + R_2} \quad (6)$$

Utilizando la relación de las resistencias obtenida anteriormente tenemos que:

$$5\tau = \frac{7CR_1}{2} \leq 5 \times 10^{-3} \quad (7)$$

despejando C obtenemos finalmente la relación entre C y R_1 :

$$C \leq \frac{1}{700R_1} \quad (8)$$

Por lo que tomando un R_1 definimos ya todos los valores:

$$R_1 = 100 \Omega, R_2 = 233.33 \Omega, C = 10 \mu F \leq 14.29 \mu F \quad (9)$$

2.5.2 Circuito de Salida

El circuito de salida consta basicamente de los displays de 7 segmentos y 8 leds normales

Para el dimensionamiento de las resistencias se utilizaron valores teóricos de salida para el decodificador que es de 5 V y los valores recomendados para los displays que requieren una tensión de entrada de 2.4 V y una corriente máxima de 20 mA. Por lo que:

$$R \approx \frac{5 - 2.4}{0.02} \approx 130 \Omega \quad (10)$$

En este caso esta debería ser la resistencia teórica, no obstante a partir de este valor se puede calibrar mediante prueba y error una resistencia que nos de un valor cercano a los 0.02 A para que los displays se vean bien, en este caso debido a que la tensión de salida de los decodificadores es cercana a 4.21 V tenemos que la resistencia más apropiada es:

$$R \approx \frac{4.21 - 2.4}{0.02} \approx 90 \Omega \quad (11)$$

Figura 12: Medición de valores para resistencia de salida para los leds del display de 7 segmentos 90 ohms [imagen propia]

Mientras que para el caso de los leds normales tenemos que satisfacer una tensión de entrada de 2.4 V y una corriente máxima de 30 mA. Por lo que necesitamos un valor mínimo de resistencia de:

$$R \approx \frac{5 - 2.4}{0.03} \approx 86 \Omega \quad (12)$$

Para este caso se eligieron resistencias de 100Ω y como se muestra la Figura 13 la corriente no sobrepasa el máximo especificado.

Figura 13: Medición de valores para resistencia de salida para el led normal de 100 ohms [imagen propia]

Para efectos reales siempre se debe empezar con los valores teóricos que son los seguros y luego ir calibrando según los valores experimentales. En la Figura 12 se muestra las mediciones para la resistencia de salida escogida.

3 Análisis de Resultados

En este apartado se mostrarán capturas de pantalla del funcionamiento del circuito en la simulación. Además se creó un video donde se ve el funcionamiento completo, el cual se puede consultar en esta dirección:

<https://youtu.be/tLjH4OtIXg4>

En la Figura 14 se muestra el funcionamiento para la carga ALTA y se puede notar como el led ON esta encendido junto con el indicador de carga alta y el de secuencia que indica suministro de agua, también se puede ver el valor de la cuenta regresiva en los displays de 7 segmentos.

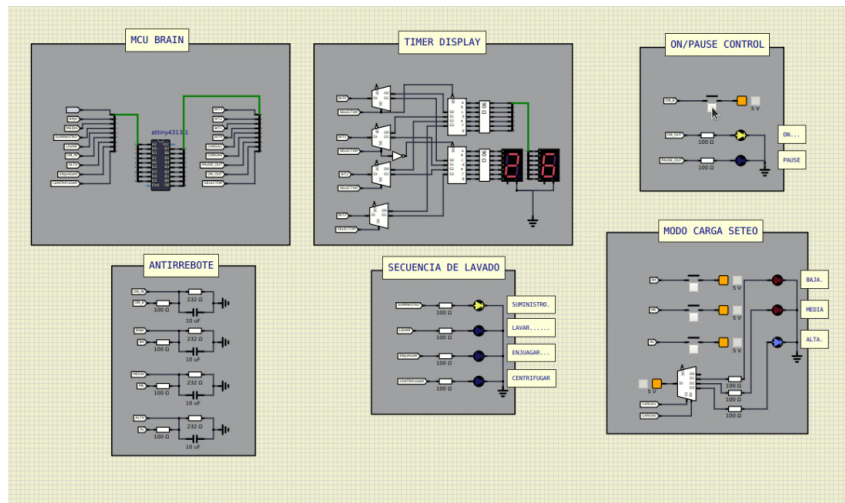

Figura 14: Estado IDLE trabajando [imagen propia]

En la Figura 15 se muestra el funcionamiento de PAUSE para una carga media en la etapa enjuagar, nótese los leds que indican todo esto en dicha figura.

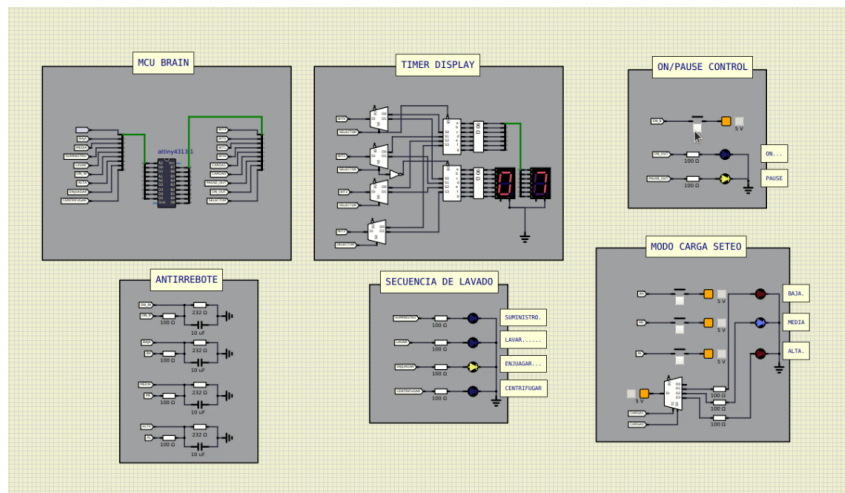

Figura 15: Estado Normal Trabajando [imagen propia]

Se recalca que para el caso de evaluar estos resultados de una forma más clara lo mejor es ver el video que se agregó, en él se muestra de manera rápida pero completa el funcionamiento del circuito.

4 Conclusiones y Recomendaciones

En el presente trabajo se mostró como un microcontrolador, específicamente el ATTINY4313, puede ser usado para realizar un tarea relativamente simple, como es el control de una lavadora, en este caso solo se controlaban leds pero podría usarse para controlar motores o bombas. Se lograron completar todas las especificaciones solicitadas.

4.1 Recomendaciones

Se recomienda empezar tomando en cuenta el número de pines disponibles, además siempre se debe considerar la cantidad de memoria disponible, para lo primero funcionó crear el archivo de simulación antes de empezar con el firmware para determinar que pines se iba a utilizar para que cosa. Una recomendación para el momento de crear el firmware es dividir en un buen número de funciones descriptivas, por ejemplo en este caso cuando se iba a desactivar o activar una interrupción se creó una función especial para esto, con lo cual era más legible y fácil de implementar y seguir en el código, lo mismo se puede hacer con lo referente a los pines para saber que hace cada uno de manera rápida.

74HC/HCT4511 BCD to 7-segment latch/decoder/driver

Product specification
File under Integrated Circuits, IC06

December 1990

BCD to 7-segment latch/decoder/driver

74HC/HCT4511

FEATURES

- Latch storage of BCD inputs
- Blanking input
- Lamp test input
- Driving common cathode LED displays
- Guaranteed 10 mA drive capability per output
- Output capability: non-standard
- I_{CC} category: MSI

GENERAL DESCRIPTION

The 74HC/HCT4511 are high-speed Si-gate CMOS devices and are pin compatible with "4511" of the "4000B" series. They are specified in compliance with JEDEC standard no. 7A.

The 74HC/HCT4511 are BCD to 7-segment latch/decoder/drivers with four address inputs (D₁ to D₄), an active LOW latch enable input (\overline{LE}), an active LOW

ripple blanking input (\overline{BI}), an active LOW lamp test input (\overline{LT}), and seven active HIGH segment outputs (Q_a to Q_g).

When \overline{LE} is LOW, the state of the segment outputs (Q_a to Q_g) is determined by the data on D₁ to D₄.

When \overline{LE} goes HIGH, the last data present on D₁ to D₄ are stored in the latches and the segment outputs remain stable.

When \overline{LT} is LOW, all the segment outputs are HIGH independent of all other input conditions. With \overline{LT} HIGH, a LOW on \overline{BI} forces all segment outputs LOW. The inputs \overline{LT} and \overline{BI} do not affect the latch circuit.

APPLICATIONS

- Driving LED displays
- Driving incandescent displays
- Driving fluorescent displays
- Driving LCD displays
- Driving gas discharge displays

QUICK REFERENCE DATA

GND = 0 V; T_{amb} = 25 °C; t_r = t_f = 6 ns

SYMBOL	PARAMETER	CONDITIONS	TYPICAL		UNIT
			HC	HCT	
t _{PHL} / t _{PLH}	propagation delay	C _L = 15 pF; V _{CC} = 5 V			
	D _n to Q _n		24	24	ns
	\overline{LE} to Q _n		23	24	ns
	\overline{BI} to Q _n		19	20	ns
	\overline{LT} to Q _n		12	13	ns
C _I	input capacitance		3.5	3.5	pF
C _{PD}	power dissipation capacitance per latch	notes 1 and 2	64	64	pF

Notes

1. C_{PD} is used to determine the dynamic power dissipation (P_D in μW):

$$P_D = C_{PD} \times V_{CC}^2 \times f_i + \sum (C_L \times V_{CC}^2 \times f_o) \text{ where:}$$

f_i = input frequency in MHz

f_o = output frequency in MHz

∑ (C_L × V_{CC}² × f_o) = sum of outputs

C_L = output load capacitance in pF

V_{CC} = supply voltage in V

2. For HC the condition is V_I = GND to V_{CC}

For HCT the condition is V_I = GND to V_{CC} – 1.5 V

**NTE4049, NTE4049T
NTE4050B, NTE4050BT
Integrated Circuit
CMOS, Hex Buffer/Converter**

Description:

The NTE4049/NTE4049T (Inverting) and NTE4050B/NTE4050BT (Non-Inverting) are Hex Buffers and feature logic-level conversion using only one supply voltage (V_{DD}). The input-signal high level (V_{IH}) can exceed the V_{DD} supply voltage when these devices are used for logic level conversions. These devices are intended for use as COS/MOS to DTL/TTL converters and can drive directly two DTL/TTL loads ($V_{DD} = 5V$, $V_{OL} \leq 400mV$, $I_{OL} \geq 3.2mA$).

These devices are available in a standard 16-Lead DIP (NTE4049 and NTE4050B) and SOIC-16 surface mount (NTE4049T and NTE4050BT) type packages.

Features:

- High Sink Current for Driving 2 TTL Loads
- High-to-Low Level Logic Conversion
- Quiescent Current Specified to 20V
- Maximum Input Current of $1\mu A$ at 18V (Full Package Temperature Range)
- High "Sink" and "Source" Current Capability
- 5V, 10V, and 15V Parametric Ratings

Absolute Maximum Ratings:

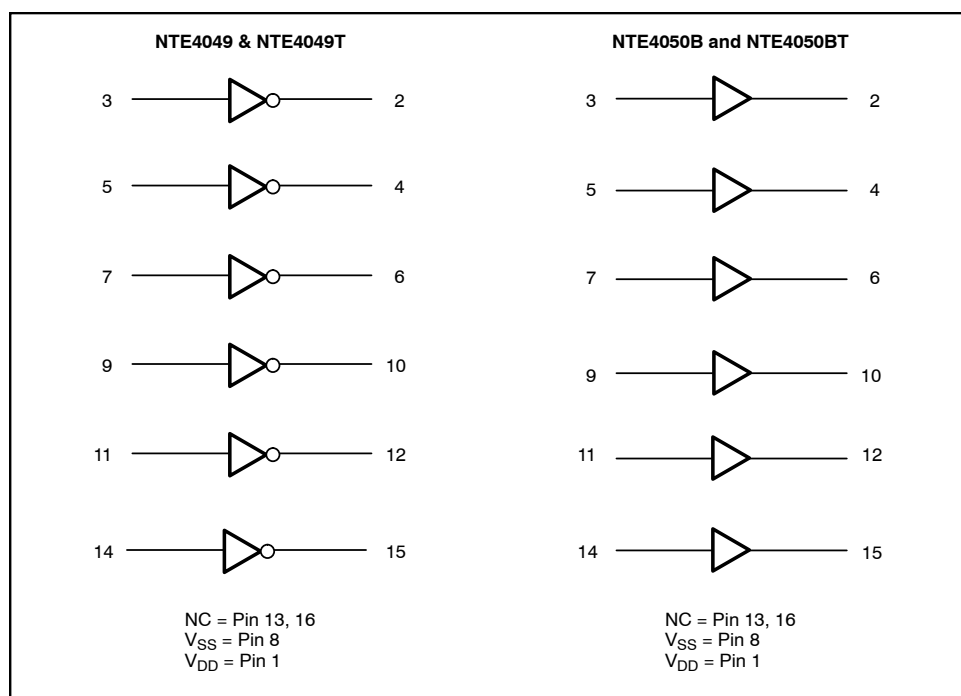

Supply Voltage (Note 1), V_{DD}	-0.5 to 20V
Input Voltage, V_I	-0.5 to $V_{DD} + 0.5V$
DC Input Current (Any One Input), I_I	$\pm 10mA$
Total Power Dissipation, P_{tot}	
Per Package	200mW
Per Output Transistor ($T_{op} = -40^\circ$ to $+85^\circ C$)	100mW
Operating Temperature Range, T_{opr}	-40° to $+85^\circ C$
Storage Temperature Range, T_{stg}	-65° to $+150^\circ C$

Note 1. All voltage values are referred to V_{SS} pin voltage.

Recommended Operating Conditions:

Supply Voltage, V_{DD}	3 to 18V
Input Voltage (Note 2), V_I	V_{DD} to 18V
Operating Temperature Range, T_{opr}	-40° to $+85^\circ C$

Note 2. The NTE4049/T and NTE4050B/BT have high-to-low-level voltage conversion capability but not low-to-high-level; therefore it is recommended that $V_{IN} \geq V_{DD}$.

Static Electrical Characteristics: (T_A = +25°C unless otherwise specified)

DUAL J-K POSITIVE-EDGE-TRIGGERED FLIP-FLOPS WITH PRESET AND CLEAR**SN54109, SN54LS109A,
SN74109, SN74LS109A**

DECEMBER 1983 — REVISED MARCH 1988

- Package Options Include Plastic "Small Outline" Packages, Ceramic Chip Carriers and Flat Packages, and Plastic and Ceramic DIPs
- Dependable Texas Instruments Quality and Reliability

description

These devices contain two independent J-K positive-edge triggered flip-flops. A low level at the preset or clear inputs sets or resets the outputs regardless of the levels of the other inputs. When preset and clear are inactive (high), data at the J and K inputs meeting the setup time requirements are transferred to the outputs on the positive-going edge of the clock pulse. Clock triggering occurs at a voltage level and is not directly related to the rise time of the clock pulse. Following the hold time interval, data at the J and K inputs may be changed without affecting the levels at the outputs. These versatile flip-flops can perform as toggle flip-flops by grounding K and tying J high. They also can perform as D-type flip-flops if J and K are tied together.

The SN54109 and SN54LS109A are characterized for operation over the full military temperature range of -55°C to 125°C. The SN74109 and SN74LS109A are characterized for operation from 0°C to 70°C.

FUNCTION TABLE (each flip-flop)						
INPUTS					OUTPUTS	
PRE	CLR	CLK	J	K	Q	\bar{Q}
L	H	X	X	X	H	L
L	L	X	X	X	L	H
L	L	X	X	X	H [†]	H [†]
H	H	↑	L	L	L	H
H	H	↑	H	L	TOGGLE	
H	H	↑	L	H	Q ₀	\bar{Q}_0
H	H	↑	H	H	H	L
H	H	L	X	X	Q ₀	\bar{Q}_0

[†] The output levels in this configuration are not guaranteed to meet the minimum levels for V_{OH} if the lows at preset and clear are near V_{IL} maximum. Furthermore, this configuration is nonstable; that is, it will not persist when preset or clear return to their inactive (high) level.

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "-" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer:The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and

continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

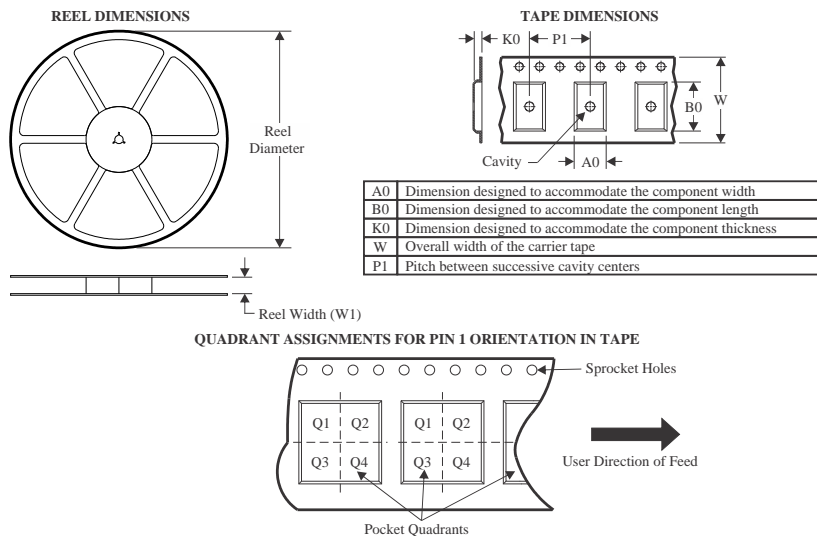

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

This electronic component has been designed and developed for usage in general electronic equipment only. This product is not authorized for use in equipment where a higher safety standard and reliability standard is especially required or where a failure of the product is reasonably expected to cause severe personal injury or death, unless the parties have executed an agreement specifically governing such use. Moreover Wurth Elektronik allows GmbH & Co KG products are neither designed nor intended for use in areas such as military, aerospace, aviation, nuclear control, submarine, transportation/automotive control, train control, ship control, transportation signal, disaster prevention, medical, public information network etc. Wurth Elektronik allows GmbH & Co KG must be informed about the intent of such usage before the design-in stage. In addition, sufficient reliability evaluation checks for safety must be performed on every electronic component which is used in electrical circuits that require high safety and reliability functions or performance.

Cautions and Warnings:

The following conditions apply to all goods within the product series of Optoelectronic Components of Würth Elektronik eiSos GmbH & Co. KG:

General:

- This optoelectronic component is designed and manufactured for use in general electronic equipment.
- Würth Elektronik must be asked for written approval (following the PPAP procedure) before incorporating the components into any equipment in fields such as military, aerospace, aviation, nuclear control, submarine, transportation (automotive control, train control, ship control), transportation signal, disaster prevention, medical, public information network, etc. where higher safety and reliability are especially required and/or if there is the possibility of direct damage or human injury.
- Optoelectronic components that will be used in safety-critical or high-reliability applications, should be pre-evaluated by the customer.
- The optoelectronic component is designed and manufactured to be used within the datasheet specified values. If the usage and operation conditions specified in the datasheet are not met, the wire insulation may be damaged or dissolved.
- Do not drop or impact the components, the component may be damaged
- Würth Elektronik products are qualified according to international standards, which are listed in each product reliability report. Würth Elektronik does not warrant any customer qualified product characteristics beyond Würth Elektronik's specifications, for its validity and sustainability over time.
- The responsibility for the applicability of the customer specific products and use in a particular customer design is always within the authority of the customer. All technical specifications for standard products also apply to customer specific products.

Product specific:

Soldering:

- The solder profile must comply with the technical product specifications. All other profiles will void the warranty.
- All other soldering methods are at the customers' own risk.

Cleaning and Washing:

- Washing agents used during the production to clean the customer application might damage or change the characteristics of the optoelectronic component body, marking or plating. Washing agents may have a negative effect on the long-term functionality of the product.
- Using a brush during the cleaning process may break the optoelectronic component body. Therefore, we do not recommend using a brush during the PCB cleaning process.

Potting:

- If the product is potted in the customer application, the potting material might shrink or expand during and after hardening. Shrinking could lead to an incomplete seal, allowing contaminants into the optoelectronic component body, pins or termination. Expansion could damage the components. We recommend a manual inspection after potting to avoid these effects.

Storage Conditions:

- A storage of Würth Elektronik products for longer than 12 months is not recommended. Within other effects, the terminals may suffer degradation, resulting in bad solderability. Therefore, all products shall be used within the period of 12 months based on the day of shipment.
- Do not expose the optoelectronic component to direct sunlight.
- The storage conditions in the original packaging are defined according to DIN EN 61760-2.
- For a moisture sensitive component, the storage condition in the original packaging is defined according to IPC/JEDEC J-STD-033. It is also recommended to return the optoelectronic component to the original moisture proof bag and reseal the moisture proof bag again.
- The storage conditions stated in the original packaging apply to the storage time and not to the transportation time of the components.

Packaging:

- The packaging specifications apply only to purchase orders comprising whole packaging units. If the ordered quantity exceeds or is lower than the specified packaging unit, packaging in accordance with the packaging specifications cannot be ensured.

Handling:

- Violation of the technical product specifications such as exceeding the nominal rated current, will void the warranty.
- The product design may influence the automatic optical inspection.
- Certain optoelectronic component surfaces consist of soft material. Pressure on the top surface has to be handled carefully to prevent negative influence to the function and reliability of the optoelectronic components.
- ESD prevention methods need to be applied for manual handling and processing by machinery.
- Resistors for protection are obligatory.
- Luminaires in operation may harm human vision or skin on a photo-biological level. Therefore direct light impact shall be avoided. All products are additionally certified as risk groups 0 to 2 according to DIN EN 62471:2008.
- In addition to optoelectronic components testing, products incorporating these devices have to comply with the safety precautions given in IEC 60825-1, IEC 62471 and IEC 62778
- Please be aware that Products provided in bulk packaging may get bent and might lead to derivations from the mechanical manufacturing tolerances mentioned in our datasheet, which is not considered to be a material defect.

Technical specification:

- The typical and/or calculated values and graphics of technical parameters can only reflect statistical figures. The actual parameters of each single product, may differ from the typical and/or calculated values or the typical characteristic line.
- On each reel, only one bin is sorted and taped. The bin is defined on intensity, chromaticity coordinate or wavelength and forward

Important Notes

The following conditions apply to all goods within the product range of Würth Elektronik eiSos GmbH & Co. KG:

1. General Customer Responsibility

Some goods within the product range of Würth Elektronik eiSos GmbH & Co. KG contain statements regarding general suitability for certain application areas. These statements about suitability are based on our knowledge and experience of typical requirements concerning the areas, serve as general guidance and cannot be estimated as binding statements about the suitability for a customer application. The responsibility for the applicability and use in a particular customer design is always solely within the authority of the customer. Due to this fact it is up to the customer to evaluate, where appropriate to investigate and decide whether the device with the specific product characteristics described in the product specification is valid and suitable for the respective customer application or not.

2. Customer Responsibility related to Specific, in particular Safety-Relevant Applications

It has to be clearly pointed out that the possibility of a malfunction of electronic components or failure before the end of the usual lifetime cannot be completely eliminated in the current state of the art, even if the products are operated within the range of the specifications. In certain customer applications requiring a very high level of safety and especially in customer applications in which the malfunction or failure of an electronic component could endanger human life or health it must be ensured by most advanced technological aid of suitable design of the customer application that no injury or damage is caused to third parties in the event of malfunction or failure of an electronic component. Therefore, customer is cautioned to verify that data sheets are current before placing orders. The current data sheets can be downloaded at www.we-online.com.

3. Best Care and Attention

Any product-specific notes, cautions and warnings must be strictly observed. Any disregard will result in the loss of warranty.

4. Customer Support for Product Specifications

Some products within the product range may contain substances which are subject to restrictions in certain jurisdictions in order to serve specific technical requirements. Necessary information is available on request. In this case the field sales engineer or the internal sales person in charge should be contacted who will be happy to support in this matter.

5. Product R&D

Due to constant product improvement product specifications may change from time to time. As a standard reporting procedure of the Product Change Notification (PCN) according to the JEDEC-Standard inform about minor and major changes. In case of further queries regarding the PCN, the field sales engineer or the internal sales person in charge should be contacted. The basic responsibility of the customer as per Section 1 and 2 remains unaffected.

6. Product Life Cycle

Due to technical progress and economical evaluation we also reserve the right to discontinue production and delivery of products. As a standard reporting procedure of the Product Termination Notification (PTN) according to the JEDEC-Standard we will inform at an early stage about inevitable product discontinuance. According to this we cannot guarantee that all products within our product range will always be available. Therefore it needs to be verified with the field sales engineer or the internal sales person in charge about the current product availability expectancy before or when the product for application design-in disposal is considered. The approach named above does not apply in the case of individual agreements deviating from the foregoing for customer-specific products.

7. Property Rights

All the rights for contractual products produced by Würth Elektronik eiSos GmbH & Co. KG on the basis of ideas, development contracts as well as models or templates that are subject to copyright, patent or commercial protection supplied to the customer will remain with Würth Elektronik eiSos GmbH & Co. KG. Würth Elektronik eiSos GmbH & Co. KG does not warrant or represent that any license, either expressed or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, application, or process in which Würth Elektronik eiSos GmbH & Co. KG components or services are used.

8. General Terms and Conditions

Unless otherwise agreed in individual contracts, all orders are subject to the current version of the "General Terms and Conditions of Würth Elektronik eiSos Group", last version available at www.we-online.com.

This electronic component has been designed and developed for usage in general electronic equipment only. This product is not authorized for use in equipment where a higher safety standard and reliability standard is especially required or where a failure of the product is reasonably expected to cause severe personal injury or death, unless the parties have executed an agreement specifically governing such use. Moreover Würth Elektronik eiSos GmbH & Co. KG products are neither designed nor intended for use in areas such as military, aerospace, aviation, nuclear control, submarine, transportation/automotive control, train control, ship control, transportation signal, disaster prevention, medical, public information network etc. Würth Elektronik eiSos GmbH & Co. KG must be informed about the intent of such usage before the design-in stage. In addition, sufficient reliability evaluation checks for safety must be performed on every electronic component which is used in electrical circuits that require high safety and reliability functions or performance.

74HC/HCT238

3-to-8 line decoder/demultiplexer

Product specification
File under Integrated Circuits, IC06

December 1990

3-to-8 line decoder/demultiplexer

74HC/HCT238

FEATURES

- Demultiplexing capability
- Multiple input enable for easy expansion
- Ideal for memory chip select decoding
- Active HIGH mutually exclusive outputs
- Output capability: standard
- I_{CC} category: MSI

GENERAL DESCRIPTION

The 74HC/HCT238 are high-speed Si-gate CMOS devices and are pin compatible with low power Schottky TTL (LSTTL). They are specified in compliance with JEDEC standard no. 7A.

The 74HC/HCT238 decoders accept three binary weighted address inputs (A_0 , A_1 , A_2) and when enabled,

provide 8 mutually exclusive active HIGH outputs (Y_0 to Y_7).

The "238" features three enable inputs: two active LOW (\bar{E}_1 and \bar{E}_2) and one active HIGH (E_3). Every output will be LOW unless \bar{E}_1 and \bar{E}_2 are LOW and E_3 is HIGH.

This multiple enable function allows easy parallel expansion of the "238" to a 1-of-32 (5 lines to 32 lines) decoder with just four "238" ICs and one inverter.

The "238" can be used as an eight output demultiplexer by using one of the active LOW enable inputs as the data input and the remaining enable inputs as strobes. Unused enable inputs must be permanently tied to their appropriate active HIGH or LOW state.

The "238" is identical to the "138" but has non-inverting outputs.

QUICK REFERENCE DATA

GND = 0 V; $T_{amb} = 25\text{ }^{\circ}\text{C}$; $t_r = t_f = 6\text{ ns}$

SYMBOL	PARAMETER	CONDITIONS	TYPICAL		UNIT
			HC	HCT	
t_{PHL}/t_{PLH}	propagation delay	$C_L = 15\text{ pF}$; $V_{CC} = 5\text{ V}$			
	A_n to Y_n		14	18	ns
	E_3 to Y_n		16	20	ns
	\bar{E}_n to Y_n		17	21	ns
C_I	input capacitance		3.5	3.5	pF
C_{PD}	power dissipation capacitance per package	notes 1 and 2	72	76	pF

Notes

1. C_{PD} is used to determine the dynamic power dissipation (P_D in μW):

$$P_D = C_{PD} \times V_{CC}^2 \times f_i + \sum (C_L \times V_{CC}^2 \times f_o) \text{ where:}$$

f_i = input frequency in MHz

f_o = output frequency in MHz

$\sum (C_L \times V_{CC}^2 \times f_o)$ = sum of outputs

C_L = output load capacitance in pF

V_{CC} = supply voltage in V

2. For HC the condition is $V_I = \text{GND to } V_{CC}$
For HCT the condition is $V_I = \text{GND to } V_{CC} - 1.5\text{ V}$

ORDERING INFORMATION

See "74HC/HCT/HCU/HCMOS Logic Package Information".

74HC/HCT238

DC CHARACTERISTICS FOR 74HCT

For the DC characteristics see *"74HC/HCT/HCU/HCMOS Logic Family Specifications"*.

Output capability: standard

I_{CC} category: MSI

Note to HCT types

The value of additional quiescent supply current (ΔI_{CC}) for a unit load of 1 is given in the family specifications. To determine ΔI_{CC} per input, multiply this value by the unit load coefficient shown in the table below.

INPUT	UNIT LOAD COEFFICIENT
A _n	0.70
E _n	0.40
E ₃	1.45

AC CHARACTERISTICS FOR 74HCT

GND = 0 V; t_r = t_f = 6 ns; C_L = 50 pF
